Improvements

As with any data set, it would be nice if it were cleaner. It would also be beneficial to have a more complete dataset. Looking at amenities for example, there are 81 unidentified gas stations which is more than the rest of the top 10 combined. There are 81 unidentified fast food locations compared to 43 for the 2nd highest total. Having a more complete dataset would give us a much better picture of what is available in New Orleans.

The downside to these improvements is the cost in resources. To correct, complete, and maintain the data, it would cost time and money. That would be a big factor. Also, the files as is are quite large. Adding more data would increase that as well.
